

Care & Instructions: Silicone Natural Vent Nipple™, XL Sipper Spout™, and Straw

All Pura silicone tops (nipple, spout, straw) should be inspected before each use. Pull on the tip of the item including the molded-in valve (spout and straw) in all directions. If any parts are torn, loose, frayed or otherwise damaged or weak discard and replace. For safety replace nipples, spouts and straws every 6-8 weeks and at the first sign of damage or weakness.

Pura silicone nipples, spouts and straws are not designed for teething. A teething child can weaken, tear and/or pull apart the silicone including the molded-in silicone valve in the spout and straw. For safety please take away from child after they have finished feeding or drinking.

Do not leave nipples, spouts or straws in direct sunlight or heat, or leave in sterilizing solution for longer than recommended as this will weaken the item. Pura nipples, spouts and straws are designed for Pura bottles; use on other bottles may cause premature failure.
